

**New and Improved Aqua Base 120 Adhesive
June 7, 2013**

Versico is pleased to announce a new and improved formula for Aqua Base 120 Bonding Adhesive.

The new formula features improved long-term heat aging performance, allowing for use in warranties up to 20 years. The new Aqua Base will maintain its adhesive properties similar to our time-tested products **G200SA Yellow Substrate Adhesive and TPO Bonding Adhesive**.

Another innovative new feature makes the product more user friendly during installation; the adhesive changes color as it flashes off, indicating when the membrane can be installed. The new Aqua Base adhesive is pink in color when it is first applied to the surface and dries to a light yellow color when the water has flashed-off. This is a significant advantage when using the product as a two-sided contact adhesive with either EPDM or TPO membranes, since it eliminates guesswork on the roof. When using the product for VersiFleece installations with a wet lay-in process, the adhesive should still be pink in color prior to setting the sheet.

The part number and product packaging remains the same:

<u>Part #</u>	<u>Description</u>	<u>Size</u>
307431	Aqua Base 120	5 gallon pails

UL and FM Code Approvals are available with the new formula when used as a contact adhesive. Coverage rate, approved substrates and application temperatures remain the same. Aqua Base is one of several low VOC options for adhered systems.

Sincerely,

Ronald L. Goodman
