

Retrofitting Aged Single-Ply  
August 6, 2013

For many years, Versico's VersiFleece adhered roofing system has been used successfully to retrofit existing aged single-ply roofing systems. A retrofit VersiFleece adhered system provides a quick, non-intrusive and economical recover option for owners seeking a new 15- or 20-year warranty.

This aged single-ply retrofitting option incorporates a VersiFleece membrane adhered to an acceptable, aged single-ply roof membrane using DASH or FAST Adhesive applied in bead extrusions. Adjoining sheets of VersiFleece TPO membranes are joined together with a minimum 1-1/2"-wide hot-air weld.

The attached guide-spec contains information regarding products, warranty options, and installation. For more specific installation instructions, specifiers and applicators must refer to the applicable sections of Versico's technical manual.

Please contact Versico's Systems Design and Review department to discuss specific projects, as design considerations may vary based upon existing conditions, type of construction and location. If you would like installation advice for your first project, please contact your local Field Service Representative or one of the following VersiFleece Technical Specialists.
